My Budgie | Health and record keeper

Congratulations on adopting your new feathered companion. Here are a few basic recommendations we've compiled to guide you in becoming the best caregiver possible for your small parrot. We encourage you to continue your parrot care education with numerous resources available to provide optimum care, health and enjoyment for years to come.

Record for: _

Bringing your Budgie Home

Budgies, also referred to as parakeets, in the wild are green and yellow with black contour lines. The domesticated budgie has been bred for many generation in captivity, now found in several mutations and many alluring colors.

Budgies are reputed to make great companion parrots due to there compact size, affordability, and ability to mimic human speech. Budgies can have 100 + word vocabularies!

Extremely intelligent, playful and active they love to explore, forage and learn new tricks. Even if not hand feed as babies, if well socialized with human caretakers they make tremendous pets. With gentle handling, patience and mentorship they can easily become finger tame, and even enjoy petting once you've gained their complete trust. The budgie is the least likely of parrot species to bond to one person. They are incredibly social birds by nature and need to feel part of the flock. Given the chance the companion budgie will interact with the entire family, provided he gains their trust and respect.

The busy beavers that they are, your budgie will enjoy a vast array of fun, colorful, intriguing toys. They respond very well to verbal praise and are eager to please, learning to pick up a certain card out of a deck, fetch a small ball across the bird safe room or learn new and exciting foraging skills.

They welcome challenging occupational therapy such as foraging toys and weaving materials. They enjoy daily misting or bathing, plenty of exercise and training. We recommend that you have your Budgie sexed to give you additional guidance for its future behavior and health preoccupations (have the sex confirmed based on dimorphic cere coloration).

Parakeets are reputed to have an expansive personality and some can even learn to be good talkers. They are extremely sociable birds but must be guided with loving discipline and training so they can understand the boundaries and what is expected from them. Compared to larger parrot species, their small size, quiet nature and relatively less destructive nature make these excellent feathered companions. With the participation of all members of the family, a relationship of tutor and child must be promoted and should not encourage one of mating companion. Allowing the avian companion to pair bond with human

flock member can have undesirable consequences (contribute to unfavorable behaviors such as screaming and biting).

"Versatile living quarters" for your Budgie

In order to prevent cage bonding and territorialism, your bird should be equipped with a variety of habitats to provide versatility throughout the day and a distinct retreat for the night. This will also challenge him mentally, prompting and encouraging his instincts for adaptability and

independence. Unfortunately many birds are not provided with versatile living quarters, regrettably living in a single cage dwelling day and night can have irreversible consequences that often lead to hormonally triggered undesireable behaviors and health concerns.

Day Cage

The day cage is perhaps the most important investment you can make. It should be a spacious, stimulating environment allowing for plenty of light and air. Ideally the space within the

day cage should be (actual total useable area to allow some exercise especially if this will be the only living quarters) as large as you can accommodate within your living space. The dimensions can vary based on the design of the cage and the other living quarters offered.

An exercise gym and a separate training stand are also recommended.

Sleeping Cage

Your bird should also be provided with a sleeping cage, covered at night and placed in a quiet retreat within your home to allow undisrupted sleep for your feathered companion. A "starter" cage, purchased for weaning and fledgling chicks can always be converted to the sleep (or boarding) cage once is not longer needed for its original purpose.

It is recommended that caregivers provide their parakeet with 10-12 hours of undisrupted sleep to maintain a healthy lifestyle. You'd be surprised at how quickly undesirable behaviours can be managed and eventually modified when your pet is provided with a comfortable and secure nighttime retreat. To promote an undisturbed sleep, the sleeping cage should be covered at night and located in a quiet and safe location, away from disturbances and predators (i.e. cat or dog, family entertainment room, and/or electrical devices that can make sudden noises (furnace, refrigerator).

Socialization

It's also important to socialize your Parakeet. A well-socialized bird is curious and gregarious,

takes an interest in its surroundings and thrives on attention. To help socialize your pet, you might want to consider taking him along to family events or for strolls through your neighbourhood. This can be achieved through the use of a transport cage or parrot back pack.

Avian flight harnesses are not recommended for this extremely small species. Partial flight feather grooming should be discussed with your avian veterinarian, as this may be necessary to prevent an accidental uncontrolled flight injury should your bird not have a bird proof room to fly in.

Visual Enrichment

"Bring" the flock to your feathered companion with videos intended for this purpose. Numerous amounts of wild bird footage has been compiled for companion parrots to virtually participate in social flock vocalization and communication. This boredom buster will also encourage & teach foraging skills, preening activities and social hierarchy.

Transportation

Another method of transporting your parakeet is by the use of an avian transport carrier. From his first car ride to his new home, to annual vet check-up, to grooming appointments, to "play dates" with other feathered friends - a carrier plays an essential role.

My Budgie Profile and Health Records

These forms and charts can help you record and monitor your bird's specific lifestyle, the care you are providing and the relationship he has with his family, flock and environment. These details of your parakeets' life can provide valuable information to your veterinarian, bird sitter or future adoption family. Should your pet require hospitalization or boarding, a copy of your birds profile will be useful to the clinic or bird sitters. The answers to these questions could be valuable when consulting for medical and behavioural concerns. The complex nature of these birds should not be limited to these questions. We encourage you to add as much information as possible to your parrot's profile forms. Conserve this information along with the birth certificate, feathers, photos and any health related documents.

Buyers Guide

Your new feathered companion will bring years of joy to your life. It is your responsibility to make sure your bird enjoys a healthy, happy lifestyle. Use this handy checklist to help you keep track of necessary equipment, treats and toys.

The checklists have been divided into five categories, **Nutrition & Supplements**, **Cage & Cage Accessories**, **Toys & Exercise**, **Perches**, and **Health & Training**. Each category provides a detailed list of products that are key to providing a long and healthy life for your bird. Not all items are required at all life stages of your bird. The following legend is simply there to guide you with your future purchases and can be kept as a reminder of what you have on hand and will need/want in the future.

	NEEDED	OPTIONAL	DAY	NIGHT	CARE
Essential items are an absolute must at the time of acquiring or adopting your bird.	Needed items should be provided to your bird over time as lifestages, agility and dexterity progress in order to offer an optimal lifestyle.	Optional items are suggestions and may be required according to your and your bird's lifestyle, interests and choice needs.	Recommended for use in your birds day cage. A separate day and night dwelling will favor versatility, prevent cage bonding, territorial behaviors and hormonal activity.	Recommended for use in your birds sleeping cage. A distinct, separate sleeping cage is recommended to provide optimal rest and versatility.	Care items are indispensable and should be considered in order to provide responsible health monitoring, first aid assistance and behavioral training.

Lifestyle Monitoring Charts...

My parrot's weight chart Why is this Important?

A responsible avian caretaker's health management program should include weekly weight monitoring. Keeping records of your companion's weight might highlight a health concern or suggest a diet re-evaluation. Furthermore, a weight management program can guide you to be proactive with your bird's exercise program. Should your bird suffer from any illness, this data keeping will help your veterinarian to quickly evaluate the condition of your bird.

Chick's primary lessons

This primary lesson progress chart is intended to be used along with the **EARLY PARROT EDUCATION PROGRAM**_e. Caretakers should be knowledgeable and skilled to mentor and ensure the safety and well being of the bird throughout these lessons.

To learn more about the Early Parrot Education Program, visit <u>www.hari.ca/avian-care/early-</u> <u>parrot-education/</u>

My parrot's body & mind chart

Should your avian companion start an undesirable or unusual behavior, use this chart as a preliminary assessment of the potential cause of the behavioral change. Before rushing to your avian vet, be sure to answer all questions

and then take them along with you. You will probably save valuable time, energy and money by understanding your companions behavioral condition.

You might wonder about questions in the charts, after all your bird's problem is behavioral and we are asking you questions relating to health and essentials care. The reason is quite simple, the body and the mind are intertwined so tightly that one doesn't go without the other. Just think of how you can act differently when you are not eating or

sleeping properly for awhile, sometimes what you need is not a psychologist's help but a nutritionist's help or simply a new mattress!

We've tried to cover all angles but remember that nobody knows your companion as much as you do, feel free to add any other questions and comments you think are important and pertinent. It might be a good idea to consult with a behaviorist but take the time to reflect upon the situation and try to analyze it yourself first. Sometimes, just putting things on paper helps us to understand things that seemed incomprehensible before, perhaps you might find the answer to your problem relatively easily.
